

ABHISHEK REDDY MANAM

DATA ENGINEER/FULL STACK DEVELOPER

+1 (484) 484-9961 | abhishekreddymanam@gmail.com | Wilmington, DE

SUMMARY

- Data Engineer and Full Stack Developer with 2+ years of experience building scalable data pipelines and production-grade web applications across the complete development lifecycle — from design and development through testing, deployment, and ongoing support.
- Hands-on experience designing and maintaining end-to-end data pipelines using PySpark, Apache Kafka, Apache Airflow, Snowflake, and dbt, with deployment and infrastructure management across AWS (S3, Glue, Redshift, EMR) and GCP (BigQuery, Dataflow, Pub/Sub).
- Proficient in Python and SQL for data engineering workflows — including ETL/ELT pipeline development, data modeling, real-time stream processing, batch processing, and data quality validation.
- Experienced in containerizing data services and pipeline components using Docker, implementing CI/CD workflows for automated pipeline deployments, and applying software engineering best practices — including version control, code reviews, and modular, testable pipeline design — to build data systems that are reliable and easy to maintain in production
- Strong full stack development background with expertise in React.js, TypeScript, JavaScript (ES6+), HTML5, and CSS3 on the frontend, backed by Python (Django/Flask) on the backend — building responsive, cross-browser compatible, and high-performance applications.
- Experience building and consuming RESTful APIs, integrating frontend applications with backend services, and implementing secure authentication and performance optimization across full stack projects.

SKILLS

Data Engineering:	Apache Spark / PySpark, Apache Kafka, Apache Airflow, Snowflake, dbt (data build tool), ETL / ELT Pipelines, Data Modeling, Data Warehousing, Data Lake Architecture, Stream Processing, Batch Processing, Data Quality & Validation
Languages:	Python, SQL, JavaScript (ES6+), TypeScript, HTML5, CSS3
Cloud & Infrastructure:	AWS (S3, Glue, Redshift, EMR, Lambda, EC2, IAM), GCP (BigQuery, Dataflow, Cloud Storage, Pub/Sub), Docker, CI/CD Pipelines
Database:	SQL, MySQL, SQL Server, MongoDB
Cloud & Deployment:	AWS (EC2, S3, IAM – basic), Docker, CI/CD basics
Frontend:	React.js, Material UI, Tailwind CSS, Bootstrap, jQuery, Angular (Basic), AngularJS, Responsive UI Design
Backend:	Django, Flask, RESTful APIs, Microservices Architecture, Authentication & Authorization
Database:	MySQL, SQL Server, PostgreSQL, MongoDB
Tools:	Git, GitHub, Postman, VS Code, JIRA
Development Practices:	Full SDLC, Agile / Scrum, Clean Code, Performance Optimization, Secure API Development
Operating Systems	Windows, macOS, Linux (Basic)

EDUCATION

Masters in Information System Technology | Wilmington University, Wilmington, DE

May 2026

Bachelor's in computer science | Lovely Professional University, Punjab, India

Jun 2023

EXPERIENCE

DigiUniv Technologies Private Limited, India | Data Engineer

Jun 2023 – Jul 2024

- Owned the design and deployment of production data pipelines on AWS and GCP, moving data from raw sources through transformation layers to analytics-ready outputs consumed by business and ML teams.
- Developed high-throughput real-time streaming pipelines with Apache Kafka and PySpark, handling millions of events daily while maintaining low latency and fault tolerance.
- Built and maintained a full dbt project on Snowflake — structured across staging, intermediate, and mart layers with incremental models, schema tests, and documentation that cut query costs and made the codebase easy to hand off.
- Managed complex Airflow DAG orchestration end-to-end — designed dynamic pipelines, set up SLA monitoring, configured failure alerts, and reduced manual intervention across batch workflows.
- Containerized pipeline components with Docker and wired deployments into CI/CD pipelines, making releases consistent and rollback-safe across dev, staging, and production.
- Used AWS (S3, Glue, Redshift, EMR, Lambda) and GCP (BigQuery, Dataflow, Pub/Sub) based on project needs — comfortable switching between both cloud ecosystems
- Built automated data quality checks that caught anomalies at the source, preventing bad data from reaching dashboards or breaking downstream models.
- Reviewed code, mentored interns, and helped raise team standards around documentation, naming conventions, and pipeline design patterns

DigiUniv Technologies Private Limited, India | Data Engineering

Jun 2022 – Jun 2023

- Worked across the full data stack from day one — ingesting raw data, transforming it through pipeline layers, and delivering clean tables that analysts could query directly.
- Built and supported ETL pipelines on AWS (S3, Glue, Lambda) and GCP (Cloud Storage, BigQuery), learning how large-scale data movement works in a live production system.

- Scheduled and monitored workflows in Apache Airflow — wrote DAGs, handled task dependencies, and debugged failed runs without always needing senior help.
- Wrote dbt models in Snowflake under senior guidance — picked up staging-to-mart layering, test writing, and documentation practices early in the role.
- Processed large datasets using PySpark, understanding firsthand why distributed computing exists and where pandas simply can't scale.
- Got hands-on with Kafka for streaming use cases — worked with topics, producers, and consumers in a real pipeline environment, not just tutorials.
- Used Docker to manage local dev environments and understood why environment parity across the team matters in production pipelines.
- Wrote Python scripts for data validation and pipeline automation, participated in code reviews, and consistently shipped cleaner code week over week.

BlockySite, India | Internship Web Developer

Jun 2022 – Jun 2023

- Built and shipped responsive web applications end-to-end — from designing UI layouts to writing backend logic and connecting everything through REST APIs, across the complete development cycle.
- Developed production-ready landing pages using React, TypeScript, HTML, and CSS — prioritizing fast load times, mobile responsiveness, and clean component structure from the start.
- Built a full-featured admin dashboard with dynamic tables, filters, data visualizations, and role-based access control — giving internal teams a reliable interface to manage users and application data.
- I wrote backend APIs and server-side logic using Python with Django/Flask — handling user authentication, CRUD operations, business logic, and proper error responses.
- Designed and managed relational databases in PostgreSQL/MySQL — created schemas, wrote complex queries, and handled migrations as the application evolved.
- Implemented end-to-end user authentication including signup, login, session management, and JWT-based authorization across full stack application builds.
- Deployed applications to AWS, managed environment configuration and build workflows, and maintained staging environments to test features before pushing to production.
- Collaborated via Git — submitted pull requests, went through code reviews, and iterated quickly on feedback, consistently improving code quality sprint over sprint.

PROJECT

AWS + Snowflake + dbt Data Pipeline | AWS S3 · Snowflake · dbt · Python · SQL · ETL

- **Designed and built a production-style end-to-end data pipeline — ingesting raw data from AWS S3 into Snowflake and transforming it through a structured Bronze → Silver → Gold layered architecture into analytics-ready datasets.**
- **Implemented the full dbt project structure — Bronze layer for raw ingestion, silver layer for cleaning and standardization, gold layer for business-level aggregations — following industry-standard medallion architecture patterns.**
- **Performed data cleaning and transformation at scale — handled null values, standardized data types, resolved schema inconsistencies, and applied business rules across transformation layers.**
- **Built a final One Big Table (OBT) model by joining multiple upstream datasets, optimized for downstream reporting and BI consumption with minimal query complexity.**
- **Wrote dbt tests and documentation across models to enforce data quality, catch schema drift, and ensure pipeline outputs were trustworthy before reaching consumers.**
- **Managed Snowflake objects including databases, schemas, warehouses, and roles — structured the environment to separate raw, staging, and production data cleanly.**

Full Stack Development, Bookish Beacon

- Developed a full-stack, client-server web application using React, Python, and SQL, enabling users to browse and search books, manage carts and wish lists, and interact with dynamic content.
- Implemented REST API integration and responsive UI design to ensure smooth user interactions and efficient data flow between frontend and backend components.
- Worked with SQL databases to manage application data, support CRUD operations, and maintain data accuracy and performance.

Full Stack Development, Gym Management System

- Designed and deployed a full-stack gym management application using React, Material UI, Python, SQL, and AWS to manage members, workout plans, and subscriptions.
- Implemented secure user authentication, role-based access control, and CRUD operations for members, plans, and payments.
- Built dynamic dashboards and responsive user interfaces to improve data visibility, usability, and overall system performance.
